

# Swim at Your Own Risk?

## Richard Whitman, MS, PhD

Port Charlotte Beach  
April 3, 2021

0.17 miles

# Fecal Indicator Bacteria (FIB)

## High bacteria

- Low energy
- Shallow slope
- Limited circulation

Study of 316 Beaches in Florida.  
Enterococci Data from 2000 to 2013 (n~160,000)

# Beaches: An Ecosystem Service

# Ecosystem Dis-service

Blue-green 'algae'

# State Florida and US EPA Swimming Criteria

Good                      0-35 enterococci per 100 ml 

Moderate                36-70 enterococci per 100 ml 

Poor =                    >71 enterococci per 100 ml 

CRITERIA ELEMENTS	Recommendation 1 Estimated Illness Rate 36/1,000		Recommendation 2 Estimated Illness Rate 32/1,000	
	GM (cfu/100 mL)	STV (cfu/100 mL)	GM (cfu/100 mL)	STV (cfu/100 mL)
Enterococci (marine & fresh)	35	130	30	110
<i>E. coli</i> (fresh)	126	410	100	320

# Examining Nonpoint Sources of FIB in Coastal Areas: A Beachshed Approach

A Conceptual Diagram of *E. coli* Within and Between Stream and Beach Watersheds

Stream

Whitman et al. 1989 to 2012

Lake

Stream to Lake

Bacterial inputs from animal defecation, storm runoff, and human activities may be deposited to riparian soils and stream sediments, where they may colonize and persist.

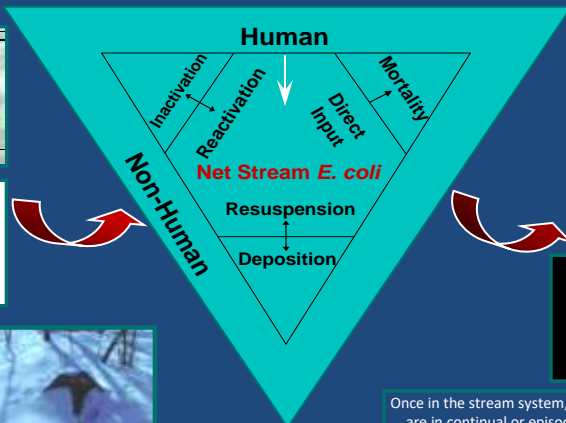

Nearshore energy (waves and currents) defines importation and exportation.

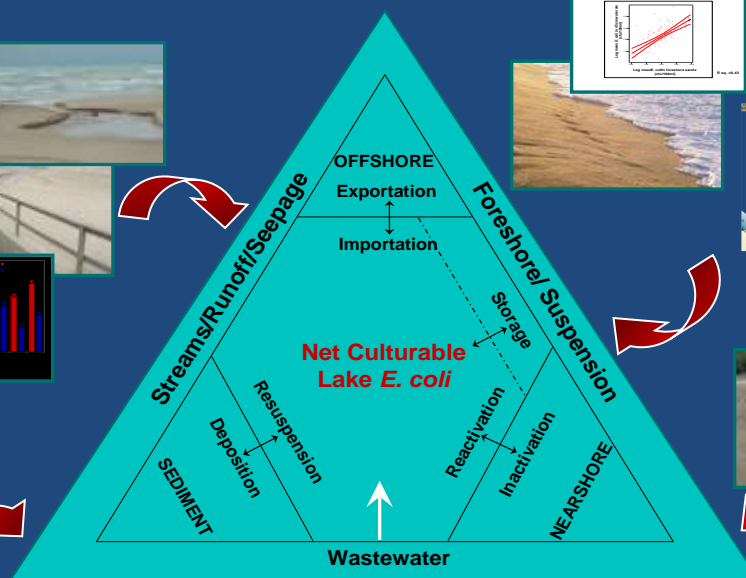

Sand harbors *E. coli* where it may persist and grow, making foreshore sand a potential sink or source to beach water.

Days after precipitation	<i>E. coli</i> counts (MPN/100 ml)
-1	$1.54 \times 10^2$
0	<1
1	$1.11 \times 10^2$
20	$9.5 \times 10^1$
28	$1.34 \times 10^2$
33	$2.42 \times 10^2$
160	$1.66 \times 10^2$
216	$1.71 \times 10^2$
250	$1.40 \times 10^2$
360	$2.50 \times 10^2$

Once in the stream system, bacteria are in continual or episodic flux between exposed water and the submerged sediment, shore, and groundwater interface.

Stream Water-A  
Stream Sand-B  
Margin Sand-C  
Sand (1 m from margin)-D  
Soil (4 m from margin)-E

**Future Challenge: Define Fluxes and Budgets**

Animal and human waste and bacteria-laden plants can be integrated into foreshore sand. Resuspension can occur through wave action and runoff.

Sunlight inactivates *E. coli*; recovery and net increase from importation may cause diurnal, seasonal, daily and even hourly variation.

Whitman, R. L., M. B. Nevers, and M. N. Byappanahalli Examination of the Watershed-Wide Distribution of *Escherichia coli* along Southern Lake Michigan: an Integrated Approach. Applied and Environmental Microbiology. 72(11), 7301-7310.

# Local Non-Point Sources

Bacteria can be integrated into foreshore sand from human, animal waste and decomposing vegetation

Sand harbors *E. coli* where it may persist and grow, making foreshore sand a potential sink or source to beach water.

# Non-point Sources

# FIB sources influence the risk of exposure to swimming-related illnesses (e.g., gastroenteritis)

<u><i>E. coli</i> source</u>	<u>Relative risk</u>
• Human feces/sewage	High
• Non-human (e.g., animal feces)	Moderate
• Environmental (e.g., plants, sand, wildlife, runoff)	poorly studied

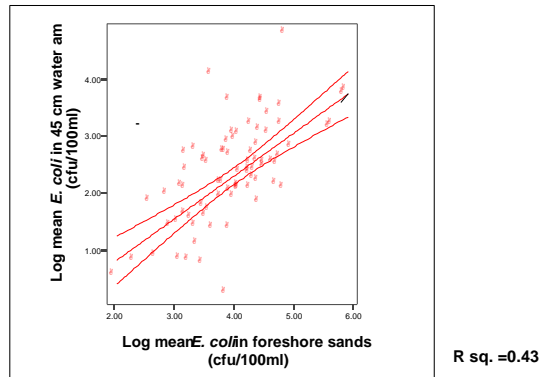

# Source identification: critical to management and remediation

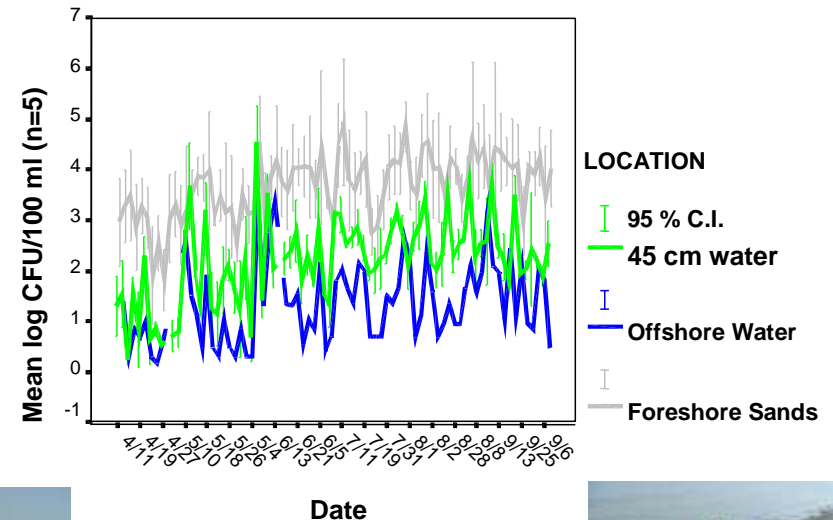

# *E. coli* in Sand May Cause Beach Closures

Linear regression of  
*E. coli* concentrations in sand and water  
63<sup>rd</sup> St. Beach, Chicago, Summer, 2000

*E. coli* in beach  
sand and water

Partial R, 45cm water vs Shore Sand = 0.501\*\*

Partial R Offshore vs Shore Sand = 0.259\*

Whitman RL, Nevers MB. 2003. **Foreshore sand as a source of *Escherichia coli* in nearshore water of a Lake Michigan beach.** Appl. Environ. Microbiol. 69:5555–5562.

**NewScientist**

- **Beach closures may be false alarm**  
November 2001

- **Beach sand can be a petri dish of bacteria**  
July 2005

- **Beach bacteria warning: That sand may be contaminated**  
July 2005

- **Beachgoers beware: Stomach bugs lurk in sand**  
July 2009
- ***E. coli* found in lake water, sand**  
August 2009

- **2 Investigators: How safe is the sand at Chicago beaches?**  
July 2013

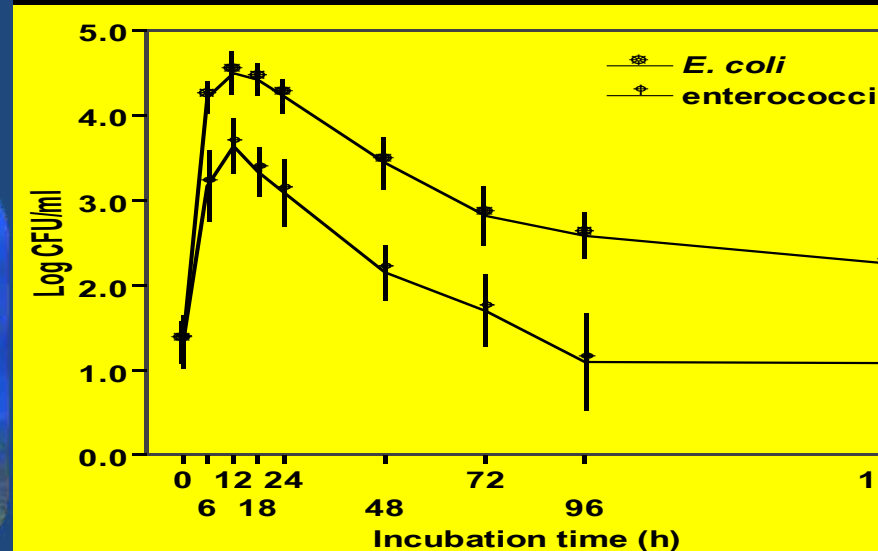

# Algae is an Issue

## Beach Thermal Image

## Pathogens

- *Salmonella*
- *Shigella*
- *Campylobacter*
- *C. perfringens*
- *C. botulinum*

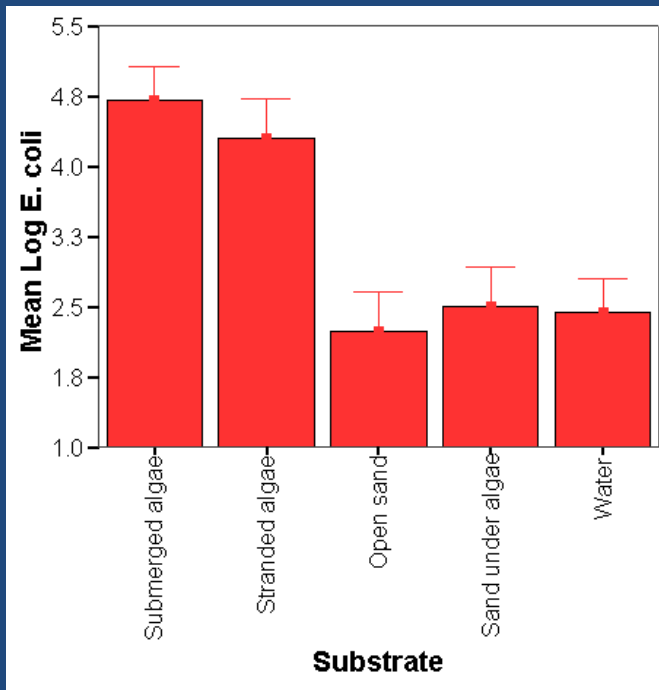

- Foul smelling beaches
- Loss of use & recreational dollars
- Citizen Complaints
- Habitat for toxic microbes
- Threat to pets, wildlife and human health
- e.g. Great Lakes bird botulism

# Algae is an Issue at Jeorse Park

- Algae is a source of *E. coli* for water and sand
  - Algae very high in *E. coli*
  - Floating algae > stranded
  - Sand under algae > open sands

*E. coli* densities for sand and algae are expressed as log MPN/g dry weight and water as log MPN/100 ml

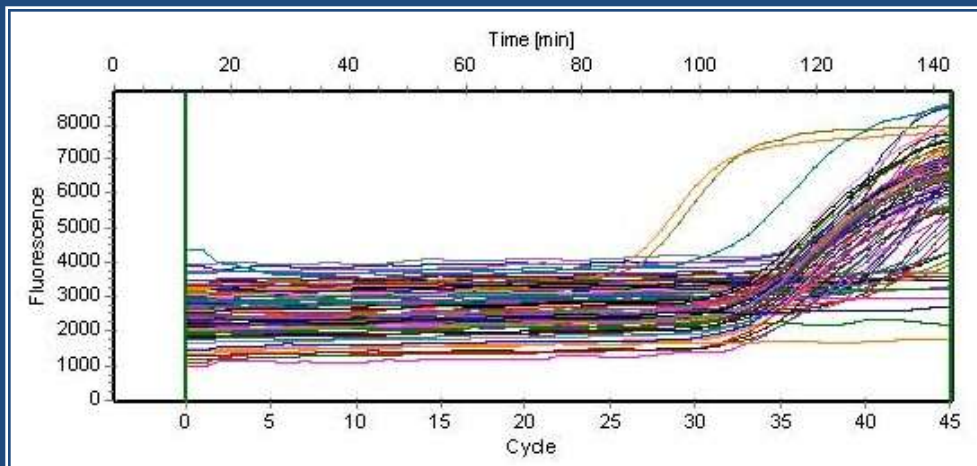

# DNA vs Culture Method

2-3 hours

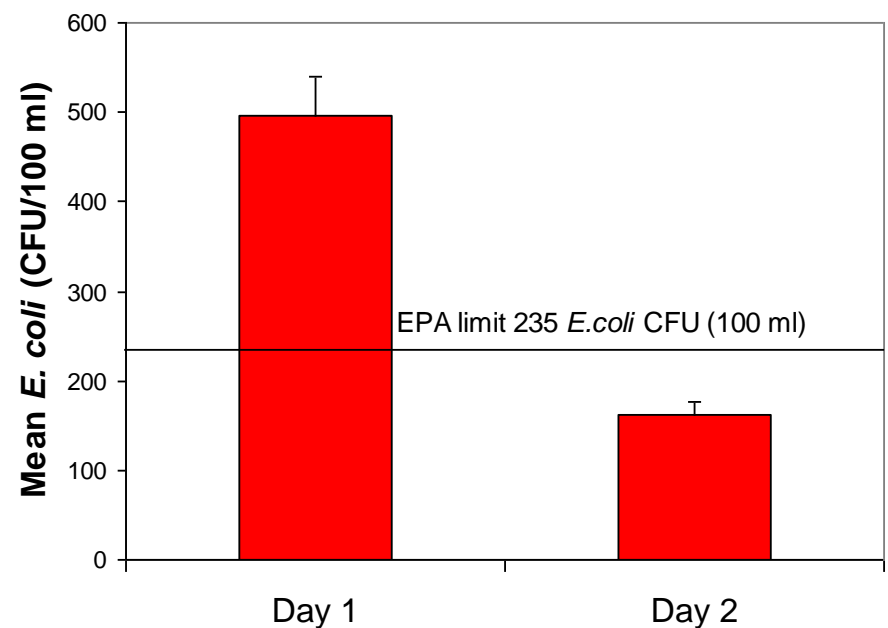

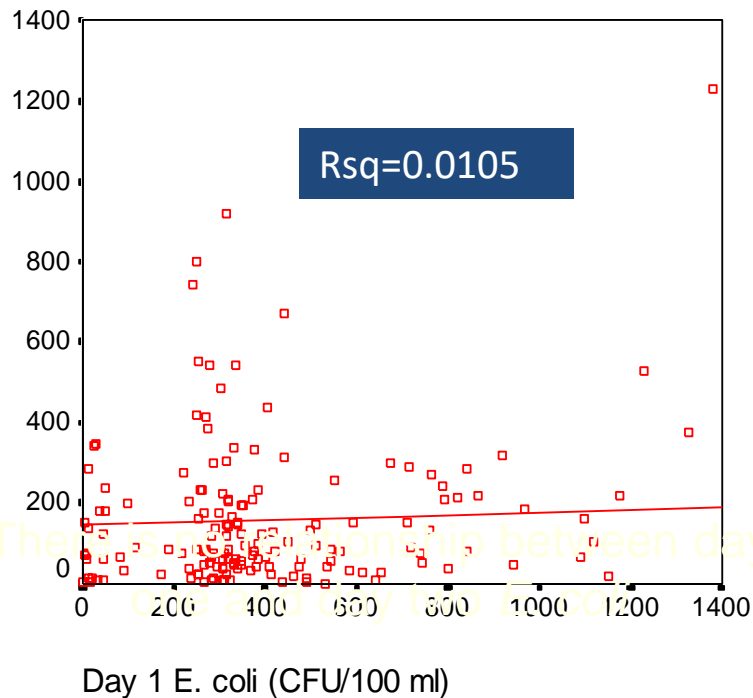

18-20 Hours

# Problems with *E. coli* monitoring protocols:

- Results not available until 18-24 hours after sample collection
- Tells you if safe to swim yesterday
- Twice a month!

# Predictive Model (S.A.F.E.) Used as a Beach Management Tool

Swimming Advisory Forecast Estimate  
and National Oceanic and Atmospheric Administration

Recreational Water Quality

Beach	SAF-E Estimate
Lake St.	OPEN
Marquette Park	OPEN
Wells St.	OPEN
Ogden Dunes	OPEN

Anticipated Beach Conditions	
Rain 24 h total (in)	0.0
Wind Speed (knot)	10
Wind Direction	SW
Air Temperature (°F)	78
Water Temperature (°F)	69
Wave Height (ft)	1-2

The EPA recommends issuing a swimming advisory when E.coli counts exceed 235 coliforms.

Port Charlotte Beach, 10/3/2011

# Conclusions

- Florida Water = Quality of Human and Wildlife
- Fecal Indictors Monitoring not 'State of the Art'?
  - Unreliable, poor notification, compliance and
  - Inadequately applied, source identification, \$
  - Better Techniques, better science, > mangagement
- Most Charlotte Co. Beaches Good (open coast)
- Port Charlotte Beach needs help
  - Social Justice Issues
  - HABs, Aesthetics

Thank You
